WHAT CAUSES PREMATURE BUDDING OF CHRYSANTHEMUM CUTTINGS  
DURING THE WINTER AND-SPRING MONTHS, AND WHAT TO DO TO  
PREVENT IT.

Bud initiation can occur any time during the Spring months whenever your temperatures in the Greenhouses are consistently 60 degrees Fahrenheit or above, and the days are short enough to initiate bud setting. These conditions can occur any time up until May 1st depending upon the variety and the locality in which they are being grown. Some varieties such as the Garden Varieties and Early shading varieties require very little short day treatment, coupled with high temperatures to initiate buds. This same tendency to set bud readily is what makes these varieties desirable for early shading and garden work.

In order to prevent this premature setting of buds, these same varieties should be placed where they can be given additional light during the winter and early spring months. Use 60 watt bulbs spaced 4 feet apart and 30 inches above the plants. Use the lights for a period of 3 hours each night after dark up until May 1st, keeping in mind that at no time should there be a period of more than  $8\frac{1}{2}$  hrs. continuous darkness.
